

PROJECT NAME: Weber County Water Infrastructure Upgrades

RECIPIENT: Weber County

LOCATION: Ogden, UT

PURPOSE: Weber County continues to have a number of water system infrastructure needs, from storm water needs that have grown with new development to water system replacement needs, such as those associated with aging infrastructure at county owned North Fork Park. Much of the storm water needs that the county has focused on include problems associated with growing development east of the I-15 corridor which has created storm water run-off problems for areas west of that corridor. In addition, some storm water problems have surfaced as a result of insufficient capacity to retain, contain or channel flows from rain storms or snow melt. Due to problems in various parts of the county, and in cases where the smaller communities may not have the financial capacity to deal with these issues, Weber County has taken the lead with a regional approach to resolving these issues. Weber County continues to seek funding assistance with high priority projects that address the most critical issues associated with storm water control by providing new and enhanced detention basins, improved canal development and maintenance, and culvert replacements to better handle the capacity problems. In addition, there is significant replacement need for new water system infrastructure at North Fork Park. Much of the infrastructure is 40 years old and the galvanized pipe that was used to run the water system is corroded and rotted away. There is significant concern about system failure. Replacing the 10,000 gallon tank with a 50,000 gallon tank would improve the operation of the park, as the south end of the park frequently runs low on water during the peak season.

AMOUNT: \$750,000
